Introductions

Mixed graphs

- A **mixed graph** is a graph in which both directed arcs and undirected edges between two distinct vertices may exist **at most once**.
- The size of a mixed graph is defined to be the number of directed arcs plus twice the number of undirected edges.

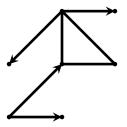

Figure: A mixed graph with size 10

A_{α} matrix and A_{α} -spectral radius of a mixed graph G

- Let $V(G) = \{1, 2, ..., n\}$ and E(G) collects all directed arcs and undirected edges of the mixed graph G.
- $A(G) = (a_{ij})$ is the adjacency matrix of G where $a_{ij} = 1$ if and only if ij is an undirected edge or ij is a directed arc in E(G).
- $D^+(G) = \text{diag}(d_1^+, d_2^+, \dots, d_n^+)$ is the out-degree matrix of G where $d_i^+ = |\{j : \overrightarrow{ij} \in E(G) \text{ or } ij \in E(G)\}|.$
- For $\alpha \in [0, 1]$, define

$$A_{\alpha}(G) = \alpha D^{+}(G) + (1 - \alpha)A(G).$$

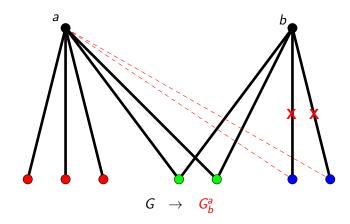

• The A_{α} -spectral radius $\rho_{\alpha}(G)$ of G is the spectral radius of $A_{\alpha}(G)$.

History

- A_{α} -matrices of undirected graphs : [Nikiforov, 2017].
- A_{α} -spectral radii of trees and unicyclic graphs : [Li, Chen, Meng, 2019].
- A_{α} -matrices of digraphs : [Liu, Wu, Chen, Liu, 2019].

Kelmans transformation

Kelmans transformation (undirected graph)

A.K. Kelmans, On graphs with randomly deleted edges, *Acta Math. Hungar* 37 (1981) 77–88.

A result of P. Csikvári

The largest real eigenvalues of adjacency matrices will not be decreased after a Kelmans transformation of an **undirected graph** G, i.e.

 $\rho(G_b^a) \ge \rho(G)$

P. Csikvári, On a conjecture of V. Nikiforov, *Discrete Math.* 309 (2009) 4522–4526.

Kelmans transformation (matrix realization)

$$egin{aligned} & A(G) = (c_{ij}) & (c_{ij} \in \{0,1\}) \ & j & a & b \ & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & &$$

For each $i, j \in [n] - \{a, b\}$, the above $t_i, s_j \in \{0, 1\}$ satisfy • $\max(0, c_{ib} - c_{ia}) \le t_i \le c_{ib}$,

•
$$\max(0, c_{bj} - c_{aj}) \leq s_j \leq c_{bj}$$
.

Generalizing to nonnegative matrices

Let $C = (c_{ij})$ be a nonnegative matrix of order n, **not necessary** symmetric, with $c_{ab} = c_{ba}$ for some $1 \le a \ne b \le n$. The Kelmans transformation of C from b to a (denoted as $C_b^a = C_b^a(t_i; s_i; k)$) is the following matrix

$$C_{b}^{a} = \begin{bmatrix} i \\ c_{ij} & c_{ia} + t_{i} & c_{ib} - t_{i} \\ c_{aj} + s_{j} & c_{aa} + k & c_{ab} \\ c_{bj} - s_{j} & c_{ba} & c_{bb} - k \end{bmatrix}$$

where $\max(0, c_{bb} - c_{aa}) \leq k \leq c_{bb}$ and for each $i, j \in [n] - \{a, b\}$:

•
$$\max(0, c_{ib} - c_{ia}) \leq \frac{t_i}{c_i} \leq c_{ib}$$
,

•
$$\max(0, c_{bj} - c_{aj}) \leq \frac{s_j}{s_j} \leq c_{bj}$$
.

Theorem on spectral radius

Let $C = (c_{ij})$ denote a nonnegative square matrix of order n such that $c_{ab} = c_{ba}$ for some $1 \le a \ne b \le n$. Choose k, t_i, s_i for $i \in [n] - \{a, b\}$ that satisfy $\max(0, c_{bb} - c_{aa}) \le k \le c_{bb}$ and for each $i, j \in [n] - \{a, b\}$:

•
$$\max(0, c_{ib} - c_{ia}) \leq t_i \leq c_{ib}$$
,

•
$$\max(0, c_{bj} - c_{aj}) \leq s_j \leq c_{bj}$$
.

Let $C_b^a = C_b^a(t_i; s_i; k)$ be the Kelmans transformation from *b* to *a* with respect to $(t_i; s_j; k)$. Then

 $\rho(C) \leq \rho(C_b^a).$

Ideal of the proof

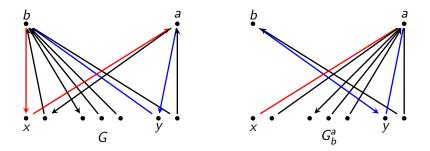

Let $w = (w_i) > 0$ be left Perron vector for $\rho(C)$ of C. We prove that

$$w_a \ge w_b \quad \Rightarrow \quad \rho(C_b^a) \ge \rho(C)$$

 $ho(C_b^a) \quad = \quad \rho(C_a^b)$

Kelmans transformation on mixed graphs

Let a, b be two vertices in mixed graph G such that a and b have either an undirected edge or have no arc. The Kelmans transformation G_b^a of G from b to a generalizes that of undirected graphs as illustrated below.

Kelman's transformation (A_{α} matrix)

Let $A = (c_{ij})$ be the adjacency matrix of a mixed graph G with $c_{ab} = c_{ba}$ for some $1 \le a \ne b \le n$. Let G_b^a be the Kelmans transformation of G from b to a. Then

 $A_{\alpha}(G_b^a) = A_{\alpha}(G)_b^a.$

Corollary

Let G be a mixed graph with two specified vertices a, b which have no arc, and let $\alpha \in [0, 1]$. Then the A_{α} -spectral radii $\rho_{\alpha}(G)$ and $\rho_{\alpha}(G_{b}^{a})$ satisfy

 $\rho_{\alpha}(G) \leq \rho_{\alpha}(G_{b}^{a}).$

Poset of mixed graphs

Poset of mixed graphs

Let [G] denote the set of mixed graphs that are isomorphic to G and

 $\mathcal{G}(n,m) := \{ [G] : G \text{ is a mixed graph of order } n \text{ and size } m \}.$

We define the order $[G] \leq [G_b^a]$ and extend the order to be a partially ordered set on $(\mathcal{G}(n, m), \leq)$.

Poset of mixed trees

Let $n, m \in \mathbb{N}$ with $n-1 \leq m \leq 2n-2$,

 $\mathcal{T}(n,m) := \{ [T] \in \mathcal{G}(n,m) \colon T \text{ is a mixed tree} \}.$

To let the set $\mathcal{T}(n, m)$ be closed under the Kelmans transformations from b to a, we need to choose a and b in the following seven situations:

$$a-b, a-x \rightarrow b, a-x \leftarrow b, a \leftarrow x-b,$$

 $a \rightarrow x-b, a \rightarrow x \leftarrow b, a \leftarrow x \rightarrow b$

Maximum elements of $\mathcal{T}(n, m)$

Proposition

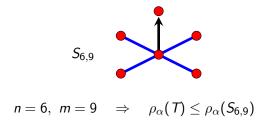

- Let $[T] \in \mathcal{T}(n, m)$. Then [T] is a maximal element in $\mathcal{T}(n, m)$ if and only if
 - (i) *T* is a **mixed star**, or
- (ii) *T* is a mixed tree without undirected edges (i.e. m = n 1) and whenever the subgraph $a \rightarrow x \leftarrow b$ or $a \leftarrow x \rightarrow b$ appears in *T*, one of *a* and *b* is a leaf.

Main Theorem

If $\alpha \in [0,1]$ and T is a mixed tree of order n and size m, then

$$\rho_{\alpha}(T) \leq \frac{1}{2} \left(\alpha n + \sqrt{\alpha^2 n^2 - 4\alpha^2 (n-1) + 4(1-\alpha)^2 (m-n+1)} \right)$$

Moreover, every mixed star of order n and size m with maximum out-degree n-1 attains the upper bound.

Theorem

If T is a mixed tree of order n and size m, and set $k = \lfloor \frac{n}{2n-m-1} \rfloor$ then

$$\rho_{\alpha}(T) \geq \rho_{\alpha}(P_k).$$

Moreover, the lower bound is attained when $T = P_n$ (m = 2n - 2, k = n).

Thank you for your time and attention!
